Isosceles-package

Isosceles: Isoform Single-Cell and Long-read Expression Suite

Description

Transcript detection and quantification from long reads

Author(s)

Tim Sterne-Weiler sternewt@gene.com

Michal Kabza michal.kabza@contractors.roche.com

bam_to_read_structures

Extract read structures from BAM files

Description

Extracts non-redundant read structures from one or multiple BAM files.

Usage

```
bam_to_read_structures(bam_files, chunk_size = 1e+06, ncpu = 1)
```

Arguments

bam_files A character vector containing BAM file paths.

chunk_size An integer scalar specifying the chunk size for reading the BAM files.

ncpu An integer scalar specifying the number of cores to use for multicore paralleliza-

tion.

Value

A data frame containing non-redundant read structure data obtained from the BAM files.

4 bam_to_tcc

bam_to_tcc

Prepare a TCC SummarizedExperiment object

Description

Prepares a TCC (Transcript Compatibility Counts) SummarizedExperiment object for the given BAM files and transcript set.

Usage

```
bam_to_tcc(
  bam_files,
  transcript_data,
  run_mode = "strict",
  min_read_count = 1,
  min_relative_expression = 0.1,
  extend_spliced_transcripts = 100,
  is_single_cell = FALSE,
  barcode_tag = "BC",
  chunk_size = 1e+06,
  ncpu = 1
)
```

Arguments

bam_files A named character vector containing BAM file paths.

transcript_data

A named list containing transcript data returned by the prepare_transcripts

function.

run_mode A string specifying the mode for choosing the transcript set ('strict', 'de novo strict',

'de_novo_loose' or 'de_novo_full').

min_read_count An integer scalar specifying the read count threshold for transcripts extracted

from the BAM files.

min_relative_expression

A numeric scalar specifying the relative expression threshold for transcripts ex-

tracted from the BAM files.

extend_spliced_transcripts

An integer scalar specifying the number of base pairs by which transcript starts

and ends are extended for spliced read compatibility search.

is_single_cell A logical scalar specifying if the BAM files contain single cell data.

barcode_tag A string specifying the name of the BAM file tag containing cell barcodes.

chunk_size An integer scalar specifying the chunk size for reading the BAM files.

ncpu An integer scalar specifying the number of cores to use for multicore paralleliza-

tion.

export_gtf 5

Value

A SummarizedExperiment object containing TCC annotation and quantification data.

export_gtf	Export data to a GTF file	

Description

Exports transcripts from a SummarizedExperiment to a GTF file.

Usage

```
export_gtf(se, file)
```

Arguments

se A transcript-level SummarizedExperiment object returned by the tcc_to_transcript

function.

file A string specifying the output file path.

Value

Nothing is returned.

neighborhood_tcc	Merge the neighboring cell TCC values in scRNA-Seq data

Description

Prepares a TCC SummarizedExperiment object where count values from the nearest k neighbors are added to the count values of each cell.

Usage

```
neighborhood_tcc(se_tcc, pca_mat, k = 10, use_annoy = FALSE, ncpu = 1)
```

Arguments

se_tcc	A TCC SummarizedExperiment object returned by the bam_to_tcc function.
pca_mat	A matrix containing PCA coordinates of each cell.
k	An integer scalar specifying the number of nearest neighbors to use.
use_annoy	A logical scalar indicating whether to use the Annoy algorithm for approximate nearest neighbor identification (recommended for big datasets).
ncpu	An integer scalar specifying the number of cores to use for multicore parallelization.

6 plot_psi_heatmap

Value

A SummarizedExperiment object containing merged TCC data.

```
plot_psi_heatmap
```

Plot a PSI heatmap

Description

Creates a heatmap of PSI (Percent Spliced In) values for the regions of a given gene across samples or cells.

Usage

```
plot_psi_heatmap(
    se_psi,
    gene_id,
    heatmap_colors = viridis::cividis(100),
    region_colors = NULL,
    ...
)
```

Arguments

se_psi	A PSI Summarized Experiment object returned by the ${\tt transcript_to_psi}$ function.
gene_id	A string containing the identifier of the gene to plot.
heatmap_colors	A character vector containing the color palette used in the heatmap.
region_colors	A named character vector of colors for the region type annotations.
	Additional parameters for the plot, passed to the pheatmap function.

Value

A plot object.

plot_psi_regions 7

Description

Creates a plot showing PSI regions and transcript structures for the given gene. Individual transcript structures are colored by their relative expression, calculated from the overall TPM values and expressed in percentages. For better visualization, introns can be shrinked using the max_intron_length argument.

Usage

```
plot_psi_regions(
    se_psi,
    se_transcript,
    gene_id,
    max_transcripts = Inf,
    max_intron_length = NULL,
    region_colors = NULL
)
```

Arguments

se_psi A PSI SummarizedExperiment object returned by the transcript_to_psi func-

tion.

se_transcript A transcript-level SummarizedExperiment object returned by the tcc_to_transcript

function.

gene_id A string containing the identifier of the gene to plot.

max_transcripts

An integer scalar specifying the maximum number of transcripts with the highest

relative expression to plot.

max_intron_length

An integer scalar specifying the maximum intron length after shrinking. If set

to NULL, no shrinking is performed.

region_colors A named character vector of colors for the PSI region types.

Value

A plot object.

8 prepare_transcripts

Description

Prepares transcript data (reference and extracted from the BAM files) for further analysis.

Usage

```
prepare_transcripts(
  gtf_file,
  genome_fasta_file,
  bam_parsed,
  min_intron_length = 30,
  known_intron_motifs = c("GT-AG"),
  rescue_annotated_introns = FALSE,
  known_intron_granges = NULL,
  min_bam_splice_read_count = 2,
  min_bam_splice_fraction = 0.1,
  bin_size = 50
)
```

Arguments

gtf_file A string containing a GTF file path. genome_fasta_file

A string containing a genome FASTA file path.

bam_parsed

A data frame containing non-redundant read structure data returned by the bam_to_read_structures function. If NULL, only reference transcripts are used.

min_intron_length

An integer scalar specifying the minimal length of introns to assign strand to.

known_intron_motifs

A character vector specifying the known intron motifs.

rescue_annotated_introns

A logical scalar specifying if introns found in genome annotations should be kept even if they don't have known intron motifs.

known_intron_granges

A GRanges object storing known intron positions (e.g. from short read data) used for transcript classification. If set to NULL, only introns from reference annotations are used.

min_bam_splice_read_count

An integer scalar specifying the read count threshold for splice sites confirmed by aligned reads.

min_bam_splice_fraction

A numeric scalar specifying the minimum connectivity fraction to a known splice site for splice sites confirmed by aligned reads.

pseudobulk_tcc 9

bin_size An integer scalar specifying the bin size for transcript start and end position binning.

Value

A named list containing following elements:

tx_df a data frame storing extracted transcript data

tx_granges a GRanges object storing genomic positions of extracted transcript

tx_exon_granges_list a GRangesList object storing exon genomic positions of extracted transcript

tx_intron_granges_list a GRangesList object storing intron genomic positions of extracted transcript

pseudobulk_tcc

Prepare a pseudobulk TCC SummarizedExperiment object

Description

Prepares a pseudobulk TCC SummarizedExperiment from TCC data and given cell labels.

Usage

```
pseudobulk_tcc(se_tcc, cell_labels)
```

Arguments

se_tcc A TCC SummarizedExperiment object returned by the bam_to_tcc function.

cell_labels A vector or a factor containing cell labels acting as a grouping variable.

Value

A pseudobulk SummarizedExperiment object containing TCC annotation and quantification data.

Description

Prepares a pseudotime window TCC SummarizedExperiment from TCC data and pseudotime values.

10 tcc_to_gene

Usage

```
pseudotime_tcc(
  se_tcc,
  pseudotime,
  trim = 0,
 window_size = 30,
 window_step = 15
)
```

Arguments

se_tcc A TCC SummarizedExperiment object returned by the bam_to_tcc function.

pseudotime A numeric vector containing the pseudotime values for each cell. Cells not

belonging to the analyzed trajectory should be denoted using NA values.

A numeric scalar specifying the fraction (0 to 0.5) of cells to be trimmed from trim

each end of the pseudotime spectrum.

An integer scalar specifying the window size. window_size window_step An integer scalar specifying the window step.

Value

A SummarizedExperiment object containing TCC data for pseudotime windows.

Prepare a gene-level SummarizedExperiment object tcc_to_gene

Description

Prepares a gene-level SummarizedExperiment from TCC data.

Usage

```
tcc_to_gene(se_tcc)
```

Arguments

se_tcc

A TCC SummarizedExperiment object returned by a function from the Isosceles-package.

Value

A SummarizedExperiment object containing gene annotation and quantification data.

tcc_to_transcript 11

tcc to	o transcript	Prenare i

Prepare a transcript-level SummarizedExperiment object

Description

Prepares a transcript-level SummarizedExperiment from TCC data using the EM algorithm.

Usage

```
tcc_to_transcript(
  se_tcc,
  em.maxiter = 250,
  em.conv = 0.01,
  use_length_normalization = TRUE,
  ncpu = 1
)
```

Arguments

se_tcc A TCC SummarizedExperiment object returned by a function from the Isosceles-package.

em.maxiter An integer scalar specifying the maximum number of EM iterations.

em. conv A numeric scalar specifying the EM convergence threshold.

use_length_normalization

A logical scalar specifying if normalization using effective transcript lengths

should be used during EM.

ncpu An integer scalar specifying the number of cores to use for multicore paralleliza-

tion.

Value

A SummarizedExperiment object containing transcript annotation and quantification data.

transcript_to_psi

Prepare a PSI SummarizedExperiment object

Description

Prepares a PSI (Percent Spliced In) SummarizedExperiment object for the given transcript-level SummarizedExperiment object. PSI values are calculated for the following types of regions:

- TSS transcription start sites
- TES transcription end sites
- CE core exonic regions
- RI retained intronic regions

12 transcript_to_psi

- A5 5' alternative exonic regions
- A3 3' alternative exonic regions

TSS and TES positions are calculated based on transcripts' binned start and end coordinates extracted from their identifiers.

Usage

```
transcript_to_psi(se, ncpu = 1)
```

Arguments

se A transcript-level SummarizedExperiment object returned by the tcc_to_transcript

function.

ncpu An integer scalar specifying the number of cores to use for multicore paralleliza-

tion.

Value

A SummarizedExperiment object containing PSI annotation and quantification data.
